

CIS 366 Introduction to .NET Development using C# (Spring 2019)

Assignment 1

Requirement

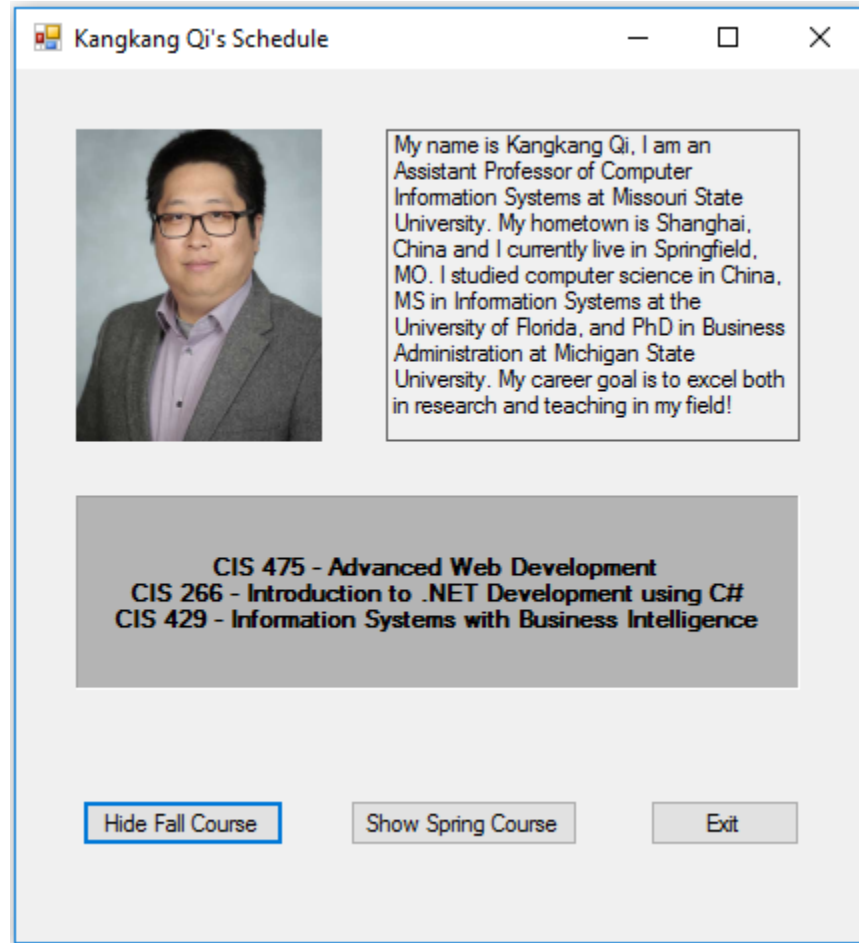

This assignment is to design a windows application to show your personal bio and course schedule for Fall and Spring semester this academic year. In this assignment, you will use Visual Studio 2015 and write C# code the for following functionalities:

1. Build a user interface that looks like this with your name and picture. The upper right label is used to show the short bio of you. The middle label is used to show your fall/spring course schedules based on the button you click. Change the properties of labels to make them look like this sample (background color can be different).

2. Program the picturebox to let it show your short bio when you click it.

3. Program the buttons to show course schedules for last fall and this spring respectively. Make sure that the texts shown in course schedule label are **bold** and **aligned in the center**. You might need to do your own research to see how to **insert a new line after each course** in C# code.

4. After you click each button to show course for that semester, change the text of that button to "Hide Fall Course" or "Hide Spring Course". If you click the button again, course schedule information should be hidden and the text of the button should be reset to "Show Fall Course" or "Show Spring Course".
5. "Exit" button should be programed to close the application.

Submission

Zip your ENTIRE project folder and name your zipped file to (yourlastname)_a1. Submit your zipped file to the Blackboard dropbox as an attachment.
